## 1. Permutation

Suppose that we are given $n$ distinct objects and wish to arrange $r$ of these objects in a line. Since there are $n$ ways of choosing the 1 st object, and after this is done, $n-1$ ways of choosing the 2 nd object, $\ldots$, and finally $n-r+1$ ways of choosing the $r$-th object, it follows by the fundamental principle of counting that the number of different arrangements, or permutations as they are often called, is given by

$$
{ }_{n} P_{r}=n(n-1) \cdots(n-r+1)=\frac{n!}{(n-r)!}
$$

where it is noted that the product has $r$ factors. We call ${ }_{n} P_{r}$ the number of permutations of $n$ objects taken r at a time.

## ((Example))

The number of different arrangements, or permutations, consisting of 2 letters each that can be formed from the 4 letters $a, b, c, d$, is

$$
{ }_{4} P_{2}=\frac{4!}{2!}=12
$$

Suppose that a set consists of $n$ objects of which $n_{1}$ are of one type (i.e., indistinguishable from each other), $n_{2}$ are of a second type, $\ldots, n_{k}$ are of a $k$-th type. Here, of course,

$$
n=n_{1}+n_{2}+\cdots+n_{k}
$$

Then the number of different permutations of the objects is

$$
\frac{n!}{n_{1}!n_{2}!\cdot \cdot n_{k}!}
$$

## 2. Combinations

In a permutation we are interested in the order of arrangement of the objects. For example, $a b c$ is a different permutation from $b c a$. In many problems, however, we are interested only in selecting or choosing objects without regard to order. Such selections are called combinations.

For example, $a b c$ and $b c a$ are the same combination. The total number of combinations of $r$ objects selected from $n$ (also called the combinations of $n$ things taken $r$ at a time) is denoted

$$
{ }_{n} C_{r}=\binom{n}{r}=\frac{n!}{(n-r)!r!}
$$

where

$$
{ }_{n} C_{r}={ }_{n} C_{n-r}
$$

## 3. Bionomial coefficient

$$
{ }_{n} C_{r}=\frac{n!}{(n-r)!r!}
$$

are often called binomial coefficients because they arise in the binomial expansion

$$
(x+y)^{n}={ }_{n} C_{0} x^{n}+{ }_{n} C_{1} x^{n-1} y+{ }_{n} C_{2} x^{n-2} y^{2}+\cdots+{ }_{n} C_{n} y^{n}
$$

((Example))

$$
\begin{aligned}
(1+x)^{3} & =1+3 x+3 x^{2}+x^{3} \\
& =\sum_{r=0}^{3}{ }_{3} C_{r} x^{r} \\
& ={ }_{3} C_{0} x^{0}+{ }_{3} C_{1} x^{1}+{ }_{3} C_{2} x^{2}+{ }_{3} C_{3} x^{3}
\end{aligned}
$$

Pascal's triangle is a triangular array of the binomial coefficients.

4. The Number of ways $\boldsymbol{W}$

In studying the probability, one is frequently concerned with the number of ways in which a specified set of events can happen in a group of events, we show what we mean by a set of events by illustrating with two or more throws of a penny. If we were to throw the same penny $N$ $(=2,3,4, \ldots)$ times , we could get the following results.
(a) $\quad N=2$ (two throws)

There are $2^{2}=4$.

| First throw | Second throw |
| :--- | :--- |
| 1 | 1 |
| 1 | 2 |
| 2 | 1 |
| 2 | 2 |

where we use 1 as head and 2 as tail.
(b) $\quad N=3$ (three throws)

There are $2^{3}=8$ ways.

| First throw | Second throw | Third throw |
| :--- | :--- | :--- |
| 1 | 1 | 1 |
| 1 | 1 | 2 |
| 1 | 2 | 1 |
| 2 | 1 | 1 |
| 1 | 2 | 2 |
| 2 | 1 | 2 |
| 2 | 2 | 1 |
| 2 | 2 | 2 |

(c) $\quad N=4$ (four throws)

There are $2^{4}=16$ ways.

| First throw | Second throw | Third throw | Fourth throw |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 1 | 1 |
| 1 | 1 | 2 | 1 |
| 1 | 2 | 1 | 1 |
| 2 | 1 | 1 | 1 |
| 1 | 2 | 2 | 1 |
| 2 | 1 | 2 | 1 |
| 2 | 2 | 1 | 1 |
| 2 | 2 | 2 | 1 |
| 1 | 1 | 1 | 2 |
| 1 | 1 | 2 | 2 |
| 1 | 2 | 1 | 2 |
| 2 | 2 | 1 | 2 |
| 1 | 1 | 2 | 2 |
| 2 | 2 | 2 | 2 |
| 2 | 2 | 1 | 2 |
| 2 | 2 | 2 |  |

## Restrictions on the ways

$$
\begin{aligned}
& W(3,1)={ }_{4} C_{3}=\frac{{ }_{4} P_{3}}{3!}=\frac{4!}{3!!!}=4, W(1,3)=\frac{4!}{3!!!}=4 \\
& W(2,2)=\frac{4!}{2!2!}=6,
\end{aligned}
$$

## Permutaion

(1) Distinguishable case: $3!=6$
abc, bac, cab, acb, bca, cba
(2) If $\mathrm{a}=\mathrm{b}$ (indistinguishable)
aac, aac, caa, aca, aca, caa $\frac{3!}{2!}=3$
(3)

Distinguishable case: $4!=4 \times 3 \times 2 \times 1=24$

Table The permutation of four letters

| abcd, | bacd, | cabd, | dabc |
| :--- | :--- | :--- | :--- |
| abdc | badc | cadb | dacb |
| acbd | bcad | cbad | dbac |
| acdb | bcda | cbda | dbca |
| adbc | bdac | cdab | dcab |
| adcb | bdca | cdba | dcba |

Table: The permutation of four letters when two are alike.

| aacd | adca |
| :--- | :--- |
| aadc | daca |
| adac | caad |
| daac | cada |
| acad | cdaa |
| acda | dcaa |

There are only 2 of these arrangements. The reason for the number 12 instead of 24 is that by assigning $b=a$, we lost the permutations of two letters ( a and b ).

$$
W_{2}=2!=2 .
$$

The distinguishable ways of permuting for four letters when two are alike is then

$$
W=\frac{W_{4}}{W_{2}}=\frac{4!}{2!}=\frac{24}{2}=12
$$
